

Lecture 6.4 Programming Exercise

Write a program called *UpdateRandomAccessFileExercise.java* that uses random access file functionality to update the file called *products.dat* that was created in an earlier exercise.

The program should update the quantity of Monkey Wrenches to 48, and add a new product to the file with the following data:

Product Number	Name	Quantity	Cost
100	Roofing Tacks	1500	\$ 7.95

Once you have your program working you may compare your solution to the sample solution provided in the course downloads folder.

You can also check that your program updated the file correctly by re-running the *ReadBinaryFileExercise.java* program that you developed previously.
